I've decided to make a mobile application with which I can keep track of my watched movies. When I am adding a movie into the application, I can specify the title, director and genre(s). Furthermore, I can specify a personal rating and add a review to the movie. A timestamp will be added automatically in order to have an idea regarding the visualisation of the movie.

Upon starting the application, a homepage will be prompted.

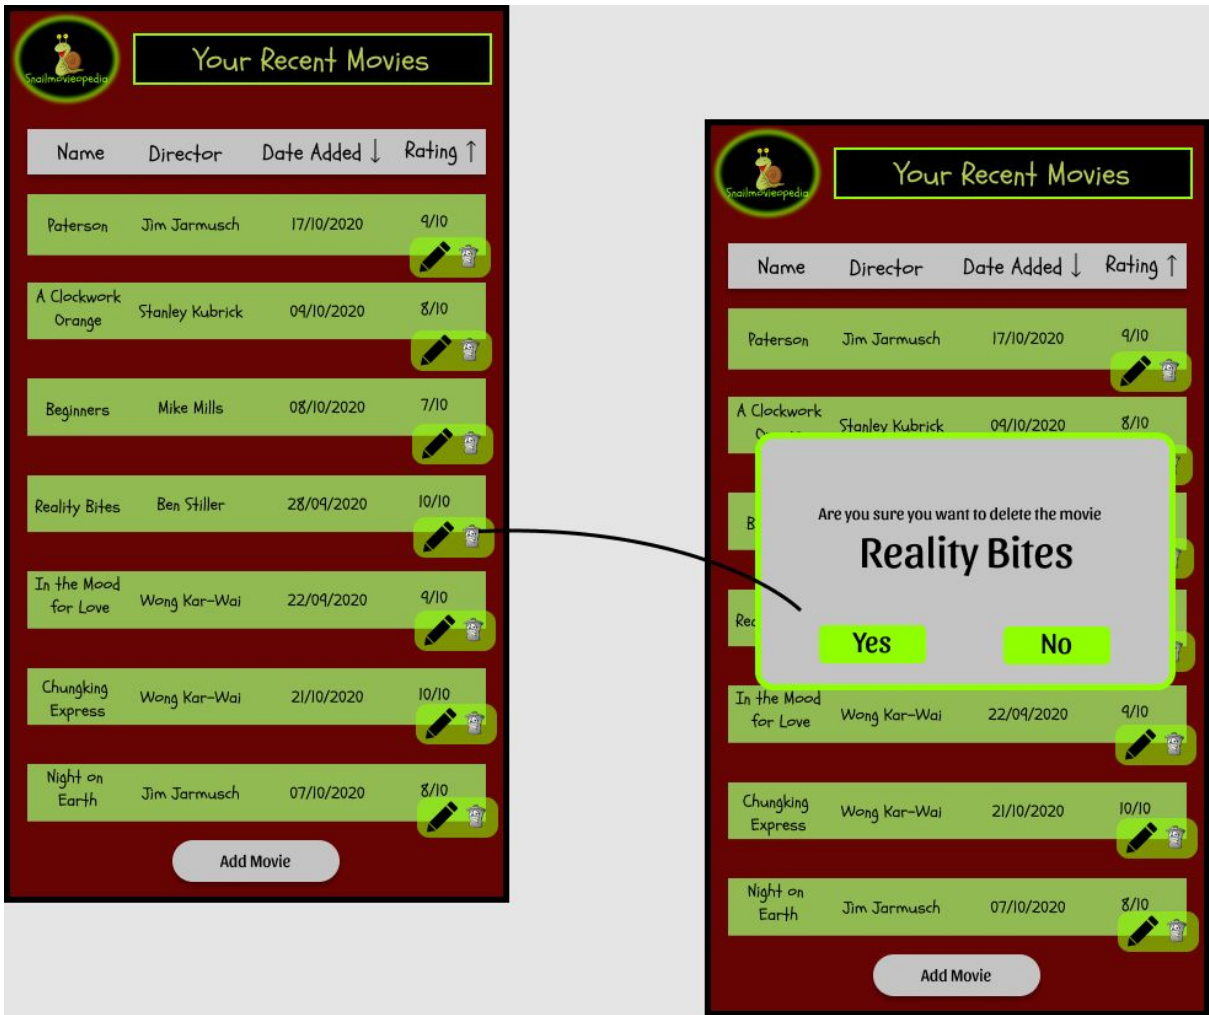

After a click anywhere, homepage#2 appears. On clicking the “welcome” button, I am then prompted to a feed that shows a list of movies already added by me.

In order to add a movie, I simply click on the add movie button on the bottom and I will be shown a specific form that needs to be completed.

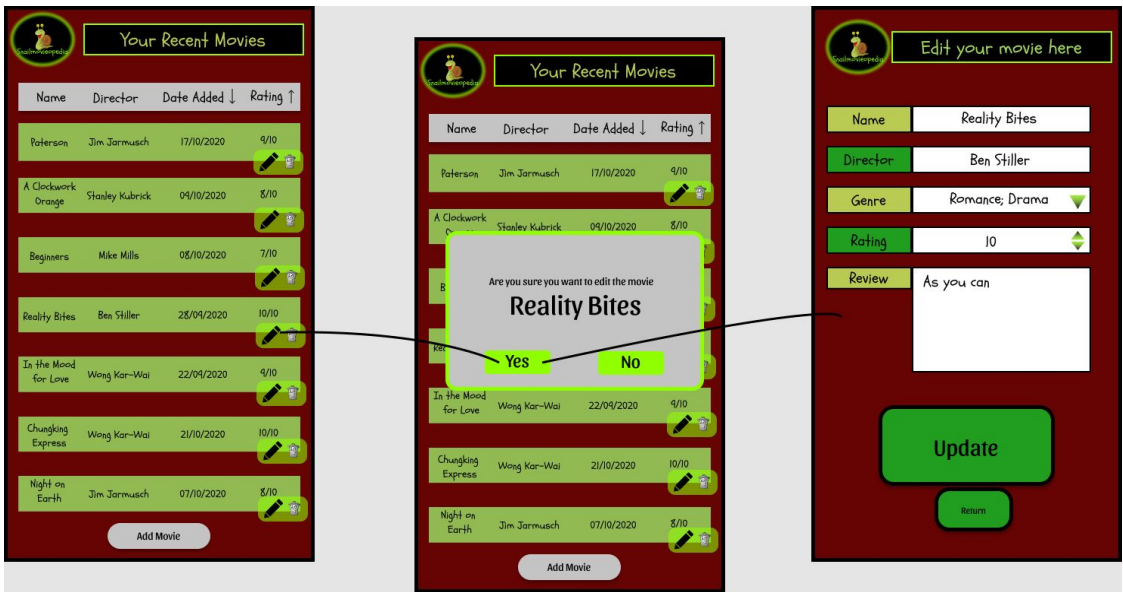

From this screen, I can choose to either add or return to the feed screen without adding anything. The successfully added movie will be shown on top of the movies list in the feed.

When it comes to deleting a movie, I can do so by clicking on the “trash” icon next to a movie. I will be shown a pop-up in order to assure that the decision to delete the movie is a correct one.

The same pop-up screen appears when I want to edit a certain movie by clicking on the “pencil” icon.

If I click on the “Yes” button on the pop-up, a different editing screen will appear. There I can edit any data and click on either “Update” that updates the movie accordingly, or click on “Return” for aborting the movie editing.

In order to see more details regarding a movie, I have to press on it for a couple of seconds.

Furthermore, by clicking on the top-left icon of the application, on any screen (since it appears everywhere), I am then prompted to the homescreen of the app.
